What are some advanced scheduling options in Appspace?

Tell Me

The channel editing feature has several niche features that may prove useful - see this FAQ for the basics of scheduling content.

- Per folder settings: clicking on the Pencil next to a folder and selecting **Configure folder settings** brings up a menu that lets you configure items on a folder-by-folder basis.

- **Filters** allow you to narrow down what content from a given folder makes it through to your channel. See more here.
- Under **Playout Properties**, you can once again set Transition, Aspect Ratio, and Duration. These settings override the defaults set in the channel-wide settings.
- **Schedule**, **Dayparting**, and **Frequency** all allow you to tune when the content shows up on the screen: See here for details.
- **Schedule and Dayparting** allow you to select when that folder's content is available to go into rotation.
- **Frequency** allows you to select how often the content comes up in the rotation. For example, setting an airtime of 50% means the folder you are editing will split the time on the screen equally with every other folder or direct allocation.
Per item settings:

- Clicking on the menu to the far right of a content item’s name provides the option to disable or move the item to the top/bottom of the list.
- Items can also be re-ordered by dragging the handle on the far left side of the content item’s bar.
- Clicking on the three-icon settings button opens a settings menu that is identical to the one at the folder level.
- Any settings applied here override both the channel default and the folder default.
- Finally, in the settings menu at the top bar of the channel, there is an option to change the layout of the channel.

See this [Appspace documentation](appspace.com) for details on editing the layout/template of a channel.
